for New recombinant ribonucleases, used for killing target cells, e.g. treating cancers, viral infections or autoimmune diseases.

Claim 1; Page 55; 71pp; English

The present sequence is Rana pipiens liver ribonuclease (RaPLR1) protein. Carboxy terminal end of RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hG3) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            It is encoded by clone sale hotelined from Rana piplens liver many library. It exhibits differences with Onconase (RIM) at amino acid residues 11, 20, 85 and 103. Carboxy terminal end of RaPIR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (HCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonucleases allows the proteins to be fused in-frame with ligand binding moieties to form cytochoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                              LL2 antibody, ligand binding moiety; CD22; cancerous B cell; onconase;

The present sequence is a recombinant Rana piplens ribonuclease (RaPIRI) protein with MerSileu. Carboxy terminal end of recombinant RaPIRI has a covalently bound ligand binding moiety, which can be a Li2 antibody directed against CD22 on cancerous B cells or human chorionic gonadorrophin (MoG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in hacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treament of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                  Recombinant Rana pipiens ribonuclease; RaPLR1 Met23Leu; covalently bound; Liz antibody; ligand binding molety; CD22, cancerous B cell; RNase; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog;

The present sequence is a recombinant Rana pipiens ribonuclease protein (RaPLR1) with Met at position 1 attached to (His)6 tag and Met24Leu. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancercus B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be

```
The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met at position I and Gln28er. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD2 on cancerous B cells or human chorionic gonadorrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an Neterminal methionine due to the presence of a signal peptide that is proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune

The present sequence is a specifically claimed example of an antitumour protein from the generic protein in AAW18224, with the molecular weight 12000. This is one of two preferred proteins (the other in AAW06543) that have been isolated from Rana pipiens occytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer treatment of tumours

This sequence represents a recombinant Onc protein comprising a 104 amino acid sequence having Gln at position 1. Onc, a ribonuclease from Rana pipiens cocytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture selection agent, e.g. to identify gene therapy compositions able to inhibit tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               - useful as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                      (RNase). The specification describes a synthetic ribonuclease protein, in which the addition of cysteine in the ribonuclease facilitates the which the addition of cysteine in the ribonuclease facilitates the chemical linking of a targeting molecule by the single reactive sulfinydryl group. The specification also describes a method for the production of rampirase using DNA technology instead of processing biological material. The re-engineering of the protein molecule allows easier attachment to a targeting molecule thereby making it possible for the ribonuclease to be delivered to a particular cell receptor where it might be most effective
                                                                                                                                                        New nucleic acids encoding a ribonuclease (Rnase), useful for the precise targeting of Rnase to a predetermined cell receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                          sequence represents a frog ribonuclease protein (ranpirnase)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Constructing isolated nucleic acid encoding ribonuclease, by subjecting desired recombinant plasmid DNA to different site-directed mutations to produce nucleic acid, using different polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Northern leopard frog; ranpirnase; site-directed mutation; ribonuclease.

             nucleic acid encoding ribonuclease protein with N-terminal Met at position -1 and Glu at position 1, where its Met has been cleaved and its Glu has been autocyclised. The method of the invention involves subjecting pET11d-rono(Gl.M2JL) plasmid DNA to two different site-directed mutations, each using overlapping PCR protocol. The method is useful for constructing an isolated nucleic acid encoding the ribonuclease. The present amino acid sequence represents the northern leopard frog rampirnase protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (rOnc) which are modifications of the RMsse Onconase (RTW) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumnor cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also lower immunogenicity in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.
                                                                                                                                                                                                                                                                                                                                      1 QDWLTFQKKHLTNTRDVDCNNIMSTNLFHCKDKNTFIYSRPEFVKAICKGIIASKNVLTT 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The protein is derived from fertilised frogg eggs. It has an iso-
electric point of 9.5 - 10.5, a blocked N-terminal gp. and is free of
earbohydrates. It is active against certain cancer cells. The combination
of the protein and (z-1-p-dimethylaminoethoxyphenyl-1, 2-diphenyl-1-
butene) citrate salt (Tamoxifent) is much more bio- active than the
separate entities against human pancreatic ASPC-1 adenocarcinoma, and the
combination of protein and (10-13-4(-methyl piperazin-1-1/1)-propyl]-2-
trifluoromethylphenochiazine (Stelazine) is much more reactive than the
separate entities against human lung A-549 carcinoma. Activity has also
been shown against human sub- maxilliary epidermoid carcinoma A-253
cells, human ovarian adeno- carcinoma NIH-0VCAR-3 cells, human leukaemic
squamous car- cinoma HT-520 cells

This pharmaceutical protein (ONCONASE) is used in the production of a bioactive pharmaceutical composition also comprising one of Cisplatin (cis-diamminedichloroplatinum), Melphalan, (4-[bis-(2-chloroethyl)amino]-L-phenylamine) or Adriamycin (Doxorubicin HCl). The composition has bioactivity in vitro against OVCAR-3 human ovarian adenocarcinoma cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                          09

Protein derived from frogs eggs.

```
of Rana pipiens frogs eggs. This protein is used for trating tumours in humans. Especially this protein was active against human submaxillary epidermoid carcinoma A-253 cells, human ovarian adenocarcinoma NIH-OVCAR03 cells, human leukaemic HL-60 cells, human COLO 320 DM cells originally isolated from colon adenocarcinoma, human LOX melanoma and human lung squamous carcinoma HT-520 cells. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a protein which was prepared by homogenisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                        Sequence 1, Application US/09394268
Patent No. 6175003
GENERAL INFORMATION:
APPLICANT: Saxena, Shailendra K
TITLE OF INVENTION: NUCLEIC ACIDS ENCODING RIBONUCLEASES AND METHODS OF
TITLE OF INVENTION: MAKING THEM
TITLE OF INVENTION: MAKING THEM
CURRENT APPLICATION NUMBER: US/09/394,268
CURRENT FILING DATE: 1999-09-10
NUMBER OF SEQ 1D NOS: 8
SOFTWARE PATENTIN Ver. 2.0

US-08-875-811-39
Sequence 39, Application US/08875811
Patent No. 6045793
GENERAL INFORMATION:
APPLICANT: Rybak, Susanna M.
APPLICANT: Boque, Lluis
APPLICANT: Boque, Lluis
TITLE OF INVENTION: Recombinant Ribonuclease Proteins
NUMBER OF SEQUENCES: 64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SOFTWARE PATENTIN Release #1.0, Version #1.30

The solution structure of a cytotoxic ribonuclease from the oocytes of Rana catesbeatana (bullfrog).";

J. Mol. Biol. 283:231-244(1998).

-! FUNCTION: Preferentially cleaves single-stranded RNA at pyrimidine residues with a 3'flanking guannine. Hydrolyzes poly(U) and poly(C) as substrates, and prefers the former. The S-lectins in frog eggs may be involved in the fertilization, and development of the frog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SMART; SM00092; RNASE Pc; 1.

Biochem. 108:139-143(1990).
-!- FUNCTION: The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin preferentially agglutinate a large variety of tumor cells, but it does not agglutinate a non-transformed cells and erythrocytes.
-!- SUBUNIT: Monomer.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family. PIR, JX0120, JX0120.
HSSP; P11916; 1BC4.

Biochem. 106:729-735(1989).
-!- CATALYTIC ACTIVITY: Endomucleolytic cleavage to nucleoside phosphates and 3'-phosphooligonucleotides ending in C-P or with 2'.3'-cyclic phosphate intermediates.
-!- SUBCELLUIAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zhao W., Beintema J.J., Hofsteenge J.; "The amino acid sequence of iguana (Iguana iguana) pancreatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 111;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-FEB-1994 (Rel. 28, Created)

C -1. PUNCTION: May function as a tRNA-specific ribonuclease that binds of a magiogenin is endocytosed and translocated to the nucleus, thereby promoting the endochelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).
CC Hydrolyzing cellular tRNAs (By similarity).
CC -!- SUNCELIULAR LOCATION: Secreted.

"Isolation, properties and primary structure of coypu and chinchilla pancreatic ribonuclease.";
Biochim. Biophys. Acta 453:400-409(1976).
-!- CARALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphate intermediates.
with 2',3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Biochem. J. 157:317-323 (1976).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-
phosphates and 3'-phosphooligonucleotides ending in C-P or U-P
with 2', 3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SINGLARITY: PRIORES.
-!- SIMILARITY: Pelongs to the pancreatic ribonuclease family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FIG. Evol. 19:438-445 (2002).
FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Biophys. Acta 1162:177-186(1993).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds cotion on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and

Pancratic ribonuclease (EC 3.1.27.5) - capybara
NyAlternate names: RNase 1; RNase A
C;Species: Hydrochaeris Nydrochaeris (capybara, carpincho)
C;Date: 03-Aug-1984 #sequence_revision 03-Aug-1984 #text_change 29-Oct-1999
C;Accession: A00824
R;Bebitnema, J.G.; Neuteboom, B.
G;Mol. Evol. 19, 145-152, 1983
A;Title: Origin of the duplicated ribonuclease gene in guinea-pig: comparison of the ami A;Reference number: A92957; MUID:87036770; PMID:6571219
A;Aocession: A00824
A;Aocession: A00824
C;Superfamily: pancreatic ribonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

(first entry) 25-JAN-2000

Recombinant RaPLR1 Met23Leu amino acid sequence.

Recombinant Rana pipiens ribonuclease; RaPLR1 Met23Leu; covalently bound; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; RNase; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein; cancer; frog; autoimmune disease.

Rana pipiens. Synthetic.

e.g. for New recombinant ribonucleases, used for killing target cells, treating cancers, viral infections or autoimmune diseases.

Claim 34; Page 56; 71pp; English.

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met23Leu. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerus B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant

ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cyclotoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant Met(-1) Rana pipiens ribonuclease Met23Leu-(His)6; RaPLR1; CD22; covalently bound; Li2 antibody; ligand binding moiety; RNase; cancerous B cell; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; signal peptide; recombinant ribonuclease; cytotoxic fusion protein;

Carboxy terminal end of RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD2 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases

```
The present sequence is a recombinant Rana pipiens ribonuclease (RaPLRI) protein with Met at position 1. Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding molety, which can be a LLZ antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

The present sequence is a Rana piplens Clone 5alb ribonuclease (RaPLRI). It is encoded by Clone 5alb cDNA obtained from Rana piplens liver mRNA library. It exhibits differences with Onconase (RTM) at amino acid residues 11, 20, 85 and 103. Carboxy terminal end of RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kapossi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methicnine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                             Rana pipiens ribonuclease Clone 5alb; RaPLR1; covalently bound; RNase; LL2 antibody; ligand binding moiety; CD22; cancerous B cell; onconase; Kaposi's Sarcoma; human chorionic gonadocrophin; hoc; cancer; recombinant ribonuclease; frog; signal peptide; cytotoxic fusion protein;

Carboxy terminal end of recombinant RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

                                                    The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Mer at position 1 and Gln2Ser. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD2 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an Neterminal methionine due to the presence of a signal peptide that is proteins to be fused in-frame with ligand binding moieties to form cyrotoxic fusion proteins. They can be used for treatment of cancer and
